Your open position, half-hour by half-hour, as the wind changes.

The wind forecast moves, and so does what you still have to sell. Calseda keeps each half-hour's open position and its value current the moment the forecast or a trade changes, and shows which data produced each figure.

WHAT YOU CAN'T SEE TODAY

- **The position right now.** Rebuilt from a spreadsheet when someone refreshes it, and drifting in between.
- **In a price spike.** Screens that queue every price fall behind when a trade matters most.
- **What the imbalance will cost.** Unsold power settles at the imbalance price, unseen until settlement.
- **A trade before you make it.** Nobody can quickly say what it would do to the position and its limit.

WHAT YOU'D SEE INSTEAD

- **Every half-hour, live,** worked out from the forecast and your trades, recalculated when either changes.
- **Calm in a spike.** Calseda skips the prices in between and sends the newest.
- **The battery planned with the book,** following the same prices.
- **A trade tried in private** against the position and its limit, before booking.

14:00, THE EVENING WIND FORECAST RISES

TODAY	
07:00	The day's position is set from the morning forecast.
14:00	The evening forecast rises. The sheet still shows the morning.
15:30	A refresh finds 18:00 over its limit. The 16:00 gate has closed.
Next day	The unsold power settles at the imbalance price.

WITH CALSEDA	
14:00	The forecast arrives. Every half-hour it touches is recalculated, and 18:00 goes over its limit.
14:00	The desk is told, with the cause.
14:05	A sale for 18:00 is tried privately.
14:06	It is booked. The position and its value update at once.

An example with simulated data.

WHAT CHANGES FOR YOUR DESK

- **Act before the gate closes.** A forecast change shows while the half-hour is still open for trading.
- **Fewer imbalance surprises.** What settles at the imbalance price is what you chose to leave open.

HOW IT STARTS

01
Pick one portfolio
One wind farm, or one battery.

02
Connect your data
Trades from your trading system over Kafka or REST, market data from your sources.

03
Write the calculation
Your developers, or ours.

04
Run it side by side
Compare with today's position sheet before relying on it.

Become a design partner

A pilot built around one portfolio, on generous terms in exchange for a case study published only with your approval. Calseda runs in your own environment, with your own sign-in. It replaces nothing.
